

StealthAUDIT[®] for Data Access Governance

The Problem with Unstructured Data

Everyday end-users create documents, spreadsheets, presentations, and other data types and store them on your corporate File Shares and SharePoint sites and in the cloud through SharePoint Online and OneDrive for Business. Managing and protecting unstructured data presents significant challenges to organizations of every size:

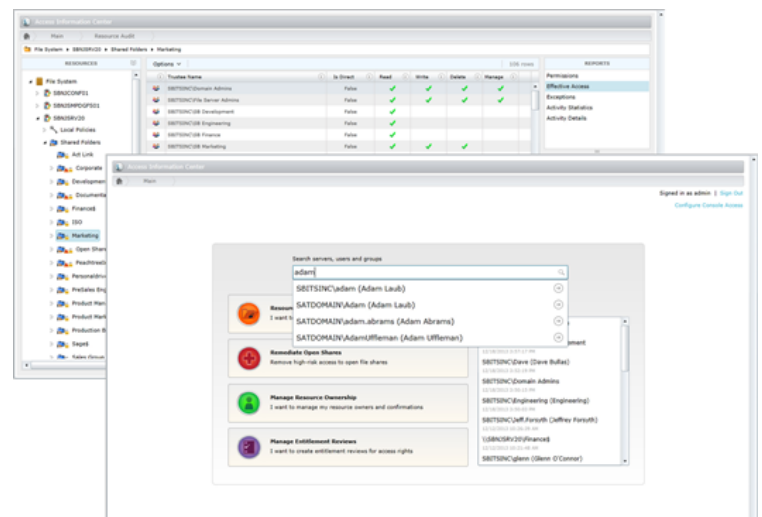

- There is a lot of it – Statistics show that unstructured data makes up about 80% of all digital information in an organization.
- It's nearly impossible to keep track of it all – It's constantly being created and updated by employees every day. How many times have you had to utilize a search function to find a document?
- Often contains sensitive data – Employee and/or customer Personally Identifiable Information (PII).

While the creation and updating of these documents is in the hands of the end-user, the act of protecting and securing access to this falls into the hands of IT. Strict audit regulations like PCI DSS, HIPAA, SOX, and others, require organizations to know who has access to certain types of data, what they're doing with it, and how users were granted that access. Couple that with the threat of insider theft and data loss, and risky conditions like Open Access in the File System and SharePoint, and today's IT administrators need help!

Solution – The StealthAUDIT Management Platform for Data Access Governance

With the StealthAUDIT Management Platform for Data Access Governance, you can meet those compliance requirements and reduce your organization's risk exposure by enabling complete and automated access governance controls over unstructured data residing in the File System, SharePoint, and in the cloud. The StealthAUDIT Management Platform was designed with a scalable and flexible architecture that allows your organization to meet present and future requirements without depleting your budget.

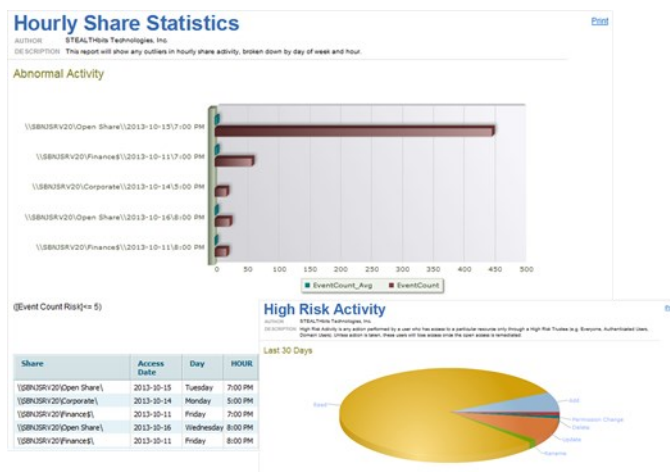

Benefits

- **Reduce Risk** – Without a proper security model in place, organizations are prone to a number of risks including insider threats, sensitive data loss, and unwanted conditions like Open Access in the File System or SharePoint or anonymously shared files in SharePoint Online or OneDrive for Business. The StealthAUDIT Management Platform provides organizations an accurate, up-to-date view of where risk lies and powerful workflows to remediate them, including sensitive data classification and Open Access remediation.

- **Empower Data Owners** – Addressing access risks is important, but maintaining correct access over time means involving those outside IT with the right context to make decisions. To properly manage data, owners must be identified and enabled to control access to their data. The StealthAUDIT Management Platform offers proven ownership workflows to identify probable owners and the ability to confirm ownership to be sure the right people have been put in charge of important access decisions.
- **Fulfill Audit Requirements** – Audit failures and compliance fines can cost companies millions of dollars, not to mention millions more in damaged reputation and business loss. The StealthAUDIT Management Platform bridges the gap between IT Management and Compliance, providing a single product for all groups within the organization to leverage in the assessment, analysis, remediation, and validation of audit and compliance requirements. With out-of-the-box capabilities, including reporting, workflows, and remediation techniques, the StealthAUDIT Management Platform ensures that all compliance regulations are met with minimal effort.
- **Integrate with Current Applications** – The StealthAUDIT Management Platform is highly extensible and offers seamless integration capabilities with third-party and home-grown applications. The StealthAUDIT Management Platform was built with an open architecture meaning the data is stored in a highly optimized SQL backend, and integration approaches are well-documented to ensure customers can truly get the most value out of the data.

Key Features

- **AD Clean-Up** – Fast data collection, complete visibility, detailed analysis, and intelligent automation for Active Directory provides a framework for cleaning up AD and ensuring that it stays clean.
- **Activity Monitoring** – Monitor activity to Windows File Systems, NetApp and EMC NAS devices for complete insight into what users are reading, changing and deleting and can provide invaluable intelligence as well as an audit trail
- **Open Access Reporting & Remediation** – Quickly assess the open access in your organization to understand what is over-exposed and at risk, including on file shares, SharePoint, and in the cloud. Intelligent remediation workflows ensure that access is fixed safely and effectively.
- **IAM Integration** – Integrate unstructured data into leading IAM frameworks (IBM SIM, Microsoft FIM, Aveksa, and SailPoint) and home-grown systems, to provision, review, and revoke access to unstructured data.
- **Local Administrator Auditing & Reporting** – Centrally maintain and monitor Local Administrator activity and group membership changes.
- **Sensitive Data Discovery** – Determine where sensitive data resides across file shares, SharePoint, and Office 365 to understand where access risk exists in order to strengthen your Data Loss Prevention initiatives.
- **Effective Access Reporting** – Gather all user’s permissions to shared folders, SharePoint, and other data repositories, and correlate the information with Active Directory to effectively determine each way a user can access a given resource, as well as the level of permission each access avenue grants.

About STEALTHbits Technologies

STEALTHbits Technologies is a data security software company focused on protecting an organization's credentials and data. By removing inappropriate data access, enforcing security policy, and detecting advanced threats, we reduce security risk, fulfill compliance requirements and decrease operations expense.

Identify threats. Secure data. Reduce risk.
