DomainTools PhishEye
Discover Phishing Domains Before They Strike

310 Million+ Known Domains in DNS

125 Million+ Known ccTLD Domains Across 300 Countries

250,000+ New Domains Discovered Each Day

20 Million New Domain IP-Resolutions Each Day

Monitor the Internet for "Phishy" Domains

Phishing and other cybercrime campaigns often use deceptive domain names to accomplish their nefarious goals. These lookalike domains can allow criminals to pose as employees or partners by spoofing email addresses, or to create deceptive links for the victim to click on. Phishing is the most often-used vector in successful data breaches; it targets an organization's employees, its customers, or the world at large, with alarming effectiveness. Fake website and phishing scams cost the average-sized organization nearly $4 million annually. Prevention is key and starts with monitoring the Internet for "phishy" domain name registrations.

DomainTools discovers more newly-registered domain names every day than any other organization in the world. PhishEye enables you to identify existing and new domains that spoof legitimate brand, product, organization, or other names, so that you can carry out defensive or investigative actions against them.

Protect your Organization with PhishEye

- Move from reactive to proactive, by identifying dangerous domains before they cause harm

- Disrupt spearphishing, such as business email compromise attacks, by blocking lookalike domains before the attacker uses them

- Mitigate or prevent brand damage caused by illegitimate domains

- Identify registrants of spoofing domains in order to monitor or initiate legal action against them

Key Features and Benefits

- The world's largest database of domains, with algorithmic generation of typos, prefixes, suffixes, and exact string inclusions, in order to find the widest variety of relevant domains

- Alerts that notify you of new domain registrations—whether or not the registrant has provisioned the domains in DNS

- Domain profile information on all discovered domains, including DomainTools Reputation Score, registrant, and other information

- Direct export to DomainTools Iris for deeper investigation

- Export to .csv for easy building of custom domain/IP blacklists

- RESTful API for automation and integration with SIEMs, TIPs, other security or forensics systems

PhishEye and Iris: a 1-2 Punch Against Phishers

Discovering suspicious or malicious domains is valuable, but it is often necessary to go deeper, to understand more about the threat actors who register these domains, and the infrastructure they control. DomainTools Iris provides unparalleled visibility into domains, registrants, IP addresses, and other profile information that helps complete the picture of an adversary. With a click, you can export the domains discovered in PhishEye into Iris. Then, by examining and pivoting on the multitudes of datapoints in Iris, you may discover much more about the adversary in order to build more comprehensive defenses against them.

Who Uses DomainTools?

The largest organizations in the world across all major verticals, including:

• Banking and Finance
• Healthcare
• Energy and Utilities
• Government
• Technology
